ABSTRACT OF THE DISCLOSURE:

A control circuit for use in a video processor utilizes 2 combined automatic kinescope bias (AKB) control, and average 3 individual beam current sensing and limiting in at least one CRT. 4 The control circuit includes automatic kinescope bias (AKB) control 5 circuitry for detecting a magnitude of individual red (R), green 6 (G) and blue (B) cathode currents driving corresponding R, G and B 7 CRTs, generating R, G and B average cathode current control signals 8 therefrom, and using the R, G and B average cathode current control signals as feedback to the video processor to reduce the R, G and B cathode currents approximately equal current amounts. beam current limiting circuitry within the control circuitry **■ 12 №**13 compares at least one of the R, G and B average current control signals with a predetermined signal, and whereupon the at least one of the R, G and B average current control signals exceeds the predetermined signal, introducing a gain reduction in corresponding 16 video gain stages within the video processor to limit the at least 17 one of the R, G and B average current control signals. 18
